

A simple, lightweight distribution

You've reached the website for **Arch Linux**, a lightweight and flexible Linux® distribution that tries to Keep It Simple.

Currently we have official packages optimized for the x86-64 architecture. We complement our official package sets with a [community-operated package repository](#) that grows in size and quality each and every day.

Our strong community is diverse and helpful, and we pride ourselves on the range of skillsets and uses for Arch that stem from it. Please check out our [forums](#) and [mailing lists](#) to get your feet wet. Also glance through our [wiki](#) if you want to learn more about Arch.

[Latest News](#)

[kea >= 1:3.0.3-6 update requires manual intervention](#)

2026-04-07

The kea package has moved all services to run as a dedicated kea user (instead of root) for improved security. This change requires permission updates to the runtime files created by the kea services.

Users upgrading from an existing kea installation should therefore run the following commands after the upgrade:

```
chown kea: /var/lib/kea/* /var/log/kea/* /run/lock/kea/logger_lockfile
```

```
systemctl try-restart kea-ctrl-agent.service kea-dhcp{4,6,-ddns}.service
```

Accounts that need to interact with kea services files (e.g. lease files under /var/lib/kea, log files under /var/log/kea or configuration files under /etc/kea) should be added to the kea group.

[iptables now defaults to the nft backend](#)

2026-04-05

The old iptables-nft package name is replaced by iptables, and the legacy backend is available as iptables-legacy.

When switching packages (among iptables-nft, iptables, iptables-legacy), check for .pacsave files in /etc/iptables/ and restore your rules if needed:

- /etc/iptables/iptables.rules.pacsave
- /etc/iptables/ip6tables.rules.pacsave

Most setups should work unchanged, but users relying on uncommon xtables extensions or legacy-only behavior should test carefully and use iptables-legacy if required.

[NVIDIA 590 driver drops Pascal and lower support; main packages switch to Open Kernel Modules](#)

2025-12-20

With the update to driver version 590, the NVIDIA driver no longer supports Pascal (GTX 10xx) GPUs or older. We will replace the nvidia package with nvidia-open, nvidia-dkms with nvidia-open-dkms, and nvidia-lts with nvidia-lts-open.

Impact: Updating the NVIDIA packages on systems with Pascal, Maxwell, or older cards will fail to load the driver, which may result in a broken graphical environment.

Intervention required for Pascal/older users: Users with GTX 10xx series and older cards must switch to the legacy proprietary branch to maintain support:

- Uninstall the official nvidia, nvidia-lts, or nvidia-dkms ...

[.NET packages may require manual intervention](#)

2025-12-11

The following packages may require manual intervention due to the upgrade from 9.0 to 10.0:

- aspnet-runtime
- aspnet-targeting-pack
- dotnet-runtime
- dotnet-sdk
- dotnet-source-built-artifacts
- dotnet-targeting-pack

pacman may display the following error failed to prepare transaction (could not satisfy dependencies) for the affected packages.

If you are affected by this and require the 9.0 packages, the following commands will update e.g. aspnet-runtime to aspnet-runtime-9.0:

```
pacman -Syu aspnet-runtime-9.0
```

```
pacman -Rs aspnet-runtime
```

[waydroid >= 1.5.4-3 update may require manual intervention](#)

2025-11-06

The waydroid package prior to version 1.5.4-2 (including aur/waydroid) creates Python byte-code files (.pyc) at runtime which were untracked by pacman. This issue has been fixed in 1.5.4-3, where byte-compiling these files is now done during the packaging process.

As a result, the upgrade may conflict with the unowned files created in previous versions. If you encounter errors like the following during the update:

```
error: failed to commit transaction (conflicting files)
```

```
waydroid: /usr/lib/waydroid/tools/__pycache__/__init__.cpython-313.pyc exists in filesystem
```

```
waydroid: /usr/lib/waydroid/tools/actions/__pycache__/__init__.cpython-313.pyc exists in filesystem
```

```
waydroid: /usr/lib/waydroid/tools/actions/__pycache__/app_manager.cpython-313.pyc exists in filesystem
```

You can safely overwrite ...
